

Northern Ontario December 6, 2007

BI Pure Water (Canada) Inc. has designed, manufactured and installed an Accu-Tab® water chlorination system for the DeBeers Victor Diamond Mine camp, located in the James Bay lowlands of Northern Ontario. The Victor mine will be the first diamond mine in Ontario. The Victor Kimberlite vein is the source of the diamonds.

The highly automated Calcium Hypochlorite system has a Chlorine analyzer to monitor the Chlorine level in the water. Three metering pumps are mounted on the unit to inject Chlorine into the water main, with one of the three on standby.

The unit was assembled and tested at the BI Pure Water facility in Surrey, BC. Our Service Technician then travelled to the remote northern site to start and commission the system. The Chlorination system has operated well since then.

The automatic chlorination system meters a Chlorine residual into the treated water

BI Pure Water specializes in reviewing water quality test results and prescribing the most cost-effective solution. BIPW Engineers pilot, design, manufacture, install, start-up and commission package water treatment plants. The operators are then trained and the plants can be serviced on a regular basis.

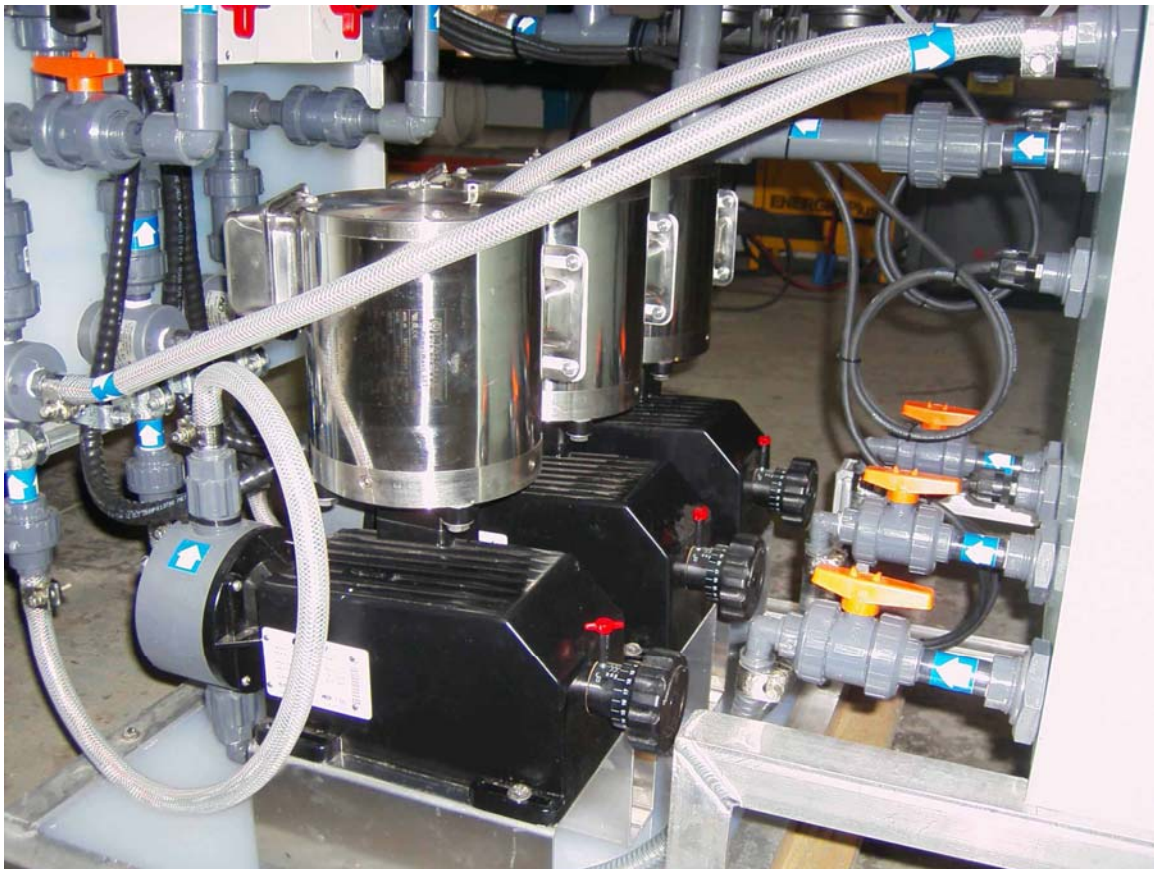

BIPW focuses on small and medium-sized water treatment plants to meet the needs of Federal, Provincial and Municipal Governments, Industrial Process, Mine Camps, Private Water Systems, Resorts & First Nations.

BI Pure Water package water treatment plants are cost-effective because:

- The water treatment plants are custom Engineered to a specific water analysis.
- The plant can be built in the Port Kell's factory where the trained staff work.
- Components & parts are readily available.
- The water treatment plant can be leak and flow tested.
- The PLC can be operated and debugged before shipping.

The benefits of using package plants are:

- More customer satisfaction due to one-stop shopping.
- No "passing the buck" to subcontractors.
- Faster installation and start-up on site.

Triple Chlorine solution injection pumps are mounted on the Chlorination unit.
